

GreenThreads L&A Liaison Analysis

Launch & Activation Customer Demand & HR Staffing Intersection

Prepared by Kristina, Launch & Activation Liaison · GreenThreads Denver Launch

Source Document

Item	Description
File	GT_MarketingB_Customers.csv
Coverage	Customer acquisition and purchasing activity across GreenThreads markets
Rows	280 customer records
Fields	Customer_ID, Home_Market, Acquisition_Channel, First Purchase Date, Last Purchase Date, Total Orders, Total Spend, Average Order Value, Days Since Last Purchase, Email Subscribed, Returns Count
Proposed by	Kristina, Launch & Activation Liaison, HW#2 source list

1. Extract: Key Data Points

The dataset contains 280 customer records from multiple GreenThreads markets and tracks customer acquisition, purchasing behavior, repeat purchases, spending patterns, and engagement after initial purchases. Analysis of the data shows that 76 of 280 customers (27.1%) placed more than one order, with customers averaging 2.2 orders each. These findings suggest that a meaningful portion of customer demand continues beyond the initial store launch and help HR anticipate staffing needs during both the opening period and ongoing operations.

Customer Metric	Finding
Customer Records	280 customer records across multiple GreenThreads markets
Repeat Customers	76 of 280 (27.1%) placed more than

	one order
Average Orders per Customer	2.2 orders per customer
Average Days Since Last Purchase	315.6 days
Acquisition Channels	Instagram (84), Google Ads (50), Facebook (45), Email (28), Organic Search (34), Referrals (22), Walk-ins (17)
HR Relevance	Customer demand after launch influences staffing, scheduling, and workforce planning

The customer data shows that customers were acquired through several channels, with Instagram accounting for the largest number of customer records (84), followed by Google Ads (50) and Facebook (45). These acquisition patterns help HR anticipate where customer demand may originate during and after a store launch.

2. Summary

The customer dataset demonstrates that GreenThreads continues to attract customers through multiple acquisition channels after store launches. The dataset shows that while some customers make only one purchase, others become repeat customers, creating staffing needs that continue beyond the grand opening. HR must prepare enough employees to support the Denver store not only for launch activities but also for sustained customer traffic after the store opens. Launch & Activation planning therefore extends beyond opening day and requires HR to align recruiting, onboarding, and scheduling with expected customer demand throughout the launch period.

3. Classification

Category	Description
Document type	Customer activity and acquisition dataset
Function of origin	Launch & Activation / Customer Analytics

Data sensitivity	Moderate. Contains customer records but no sensitive employee information.
Relevance to HR	Indirect but important. Customer demand helps HR anticipate staffing requirements before and after store launch.

4. Where Launch & Activation Creates HR Workload or Risk

Customer demand continues after launch.

Launch activities do not end on opening day. Returning customers and repeat purchases indicate that HR must prepare staffing schedules capable of supporting ongoing customer demand rather than focusing only on grand opening events.

Customer acquisition creates changing staffing demand.

GreenThreads attracts customers through several acquisition channels, including social media, referrals, email campaigns, organic search, and walk-in traffic. As Launch & Activation efforts continue, HR should anticipate changes in customer volume and adjust recruiting, scheduling, and onboarding to maintain adequate staffing.

Repeat customers require consistent staffing.

Customers with multiple purchases demonstrate that launch success depends on maintaining service quality after opening day. HR should ensure employee scheduling remains consistent so customer experience stays positive during continued growth.

AI can improve launch staffing forecasts.

AI could analyze customer acquisition trends, repeat purchasing behavior, and historical launch activity to forecast staffing requirements. Rather than reacting after customer demand changes, HR could use AI to forecast staffing needs, prioritize recruiting, adjust onboarding schedules, and recommend workforce levels before customer traffic increases.

Because the dataset does not include staffing levels or store traffic forecasts, AI would need to combine customer activity with HR hiring data to produce more accurate staffing recommendations.

5. Overlap Note

This analysis focuses on how customer acquisition and post-launch customer activity affect HR staffing readiness. It does not evaluate employer branding, marketing channel performance, financial budgets, or operational shipment delays. Instead, it examines how Launch & Activation customer trends influence recruiting, scheduling, onboarding, and workforce planning before and after the Denver store opening.

6. Assumptions Stated

- Customer activity in existing GreenThreads markets is assumed to provide a reasonable benchmark for expected customer demand following the Denver launch.
- Repeat purchasing behavior is assumed to increase staffing needs after opening day.
- Customer acquisition patterns are used to estimate staffing demand rather than predict exact customer counts.

Bottom Line for HR

Launch & Activation does not end when the store opens. Customer acquisition and repeat purchasing patterns show that HR must prepare employees for both the grand opening and continued customer demand afterward. AI-driven staffing forecasts would allow GreenThreads to recruit earlier, improve scheduling, and maintain workforce readiness throughout the launch process, helping ensure a successful Denver store opening.
