

AI.205 HW#4 — Custom AI Assistant Build

GreenThreads HR Staffing Forecast Assistant Kristina Nastally

Project

I built the GreenThreads HR Staffing Forecast Assistant, a ChatGPT Project designed to help GreenThreads HR and store management interpret customer demand, historical store activity, staffing information, and budget constraints when making workforce-planning decisions for the Denver launch. The assistant is grounded in my prior GreenThreads analysis and supporting project files and is designed to provide decision support rather than make autonomous staffing decisions.

Public GitHub Repository:

[knastally/greenthreads-hr-staffing-assistant: AI-assisted HR staffing forecast tool for GreenThreads Denver, built and tested using grounded customer, store, HR, and financial data.](https://github.com/knastally/greenthreads-hr-staffing-assistant)

What the Assistant Does Well

The assistant performs well when a staffing question can be grounded in the available GreenThreads evidence. During testing, it successfully identified relevant demand indicators, explained limitations in the available Denver data, compared staffing-planning alternatives, and preserved human review. It also resisted requests for unsupported precision. When asked for exact Denver opening-day traffic and hourly staffing figures, it stated that those numbers were not determinable from the project files rather than fabricating a forecast.

Limitation and Testing Improvement

Break testing revealed that the original assistant did not have a strong enough functional boundary. When asked an inventory and supplier-negotiation question, it correctly refused to invent quantities but still ranked suppliers and made an Operations recommendation outside its intended HR staffing role. I added a Functional Scope Guardrail requiring the assistant to stay within HR staffing and workforce-planning decision support and redirect decisions belonging to other functions. When I repeated the same test, the assistant correctly declined to make the procurement decision while still explaining the staffing implications.

Governance and Accountability

The assistant should support, not replace, human judgment. HR and Denver store management should verify important calculations, review the evidence and assumptions behind

recommendations, and retain final authority over hiring and scheduling decisions. If the assistant produces an incorrect recommendation, the human manager approving and acting on that recommendation remains accountable for the business decision. Access should also be limited appropriately because HR information may contain sensitive applicant or employee data.
